Category:Microsoft server technology Category:Microsoft Windows Server Category:Microsoft Windows-only softwareQ: C++: Pointer to a static class member I can successfully compile the following code snippet: //Test.h class Test { static int global_integer; public: Test(); }; //Test.cpp int Test::global_integer = 0; I can successfully use the program in the following manner: #include "Test.h" int main() { Test t; return 0; } But when I make Test a member of a class, the code does not compile. class Test { public: static int global_integer; Test(); }; int Test::global_integer = 0; When I try to compile, the compiler says "Test.h:9:13: error: 'Test' does not name a type" I assume the compiler is trying to point to the class Test since it is static, but I'm not sure if it's right or not. Edit: I want Test to be a member of a class since it represents some state information, but at the same time, I don't want to make it a static class. I don't want to make it a global variable either. Is there any way to do this? A: You want to initialize a data member in the class initializer list. class Test { public: static int global_integer; Test(); }; int Test::global_integer = 0; and then: Test t = Test(); Edit: If you need to initialize the member later, then you can use a separate initializer list (inside the class body, as the code you posted suggests): class Test { public: static int global_integer; Test(); }; int Test::global_integer = 0; Test t; A: Try this: class Test { static int global_integer = 0; Test(); }; int Test::global_integer = 0; A: You can initialize 4bc0debe42
